PROJECT REPORT

NAME : PIYUSH

REG.NO: 25BCE11153

TASK:1

I used Canva to create a visually appealing one page infographic aimed at helping my batchmates understand digital literacy and its importance. The infographic is organized into three main sections. The first section defines digital literacy, emphasizing the ability to find, evaluate, create, and communicate information effectively using digital tools. The second section focuses on safe internet practices, including using strong and unique passwords, being cautious with suspicious links or emails, protecting personal information, and understanding privacy settings. The third section highlights the importance of a professional online presence, such as maintaining a positive digital footprint, using professional profiles like LinkedIn, and being mindful of the content shared on social media platforms. Each section uses concise bullet points, icons, and color-coded blocks to make the information easy to digest at a glance. While designing, I found Canva's wide range of templates and drag-and-drop features extremely helpful in arranging text, visuals, and icons neatly. One challenge I encountered was condensing detailed information into a single-page infographic without overcrowding it. I learned to prioritize key points and use visuals strategically to convey ideas quickly. Overall, creating this infographic not only enhanced my own understanding of digital literacy but also demonstrated how a clear, well-designed visual can make complex topics accessible and engaging for fellow students.

TASK:2

For my project, I chose three main platforms: GitHub, Canva, and Google Workspace. GitHub is primarily used for version control and managing code repositories. It allows me to track changes, collaborate with peers, and showcase my projects publicly, which will be essential for developing my coding and software development skills over the next four years. Canva is a visual design tool that I used to create infographics and presentations. Its templates, icons, and drag-and-drop features make it easy to present information creatively, which will help me communicate ideas effectively in both academic projects and extracurricular initiatives. Google Workspace, including Google Docs, Sheets, and Slides, provides a collaborative environment for creating, editing, and sharing documents in real time. I plan to use it extensively for note taking, group assignments, project planning, and organizing my academic work. Over the next four years, I intend to leverage these platforms to improve both my technical and soft skills. GitHub will help me build a strong coding portfolio, Canva will assist in making visually engaging presentations, and Google Workspace will streamline teamwork and project management. Together, these tools will support my growth as a well-rounded computer science student.

TASK:3

For this task, I used two main platforms: HackerRank and Google Workspace. On HackerRank, I created an account and completed the beginner-level coding challenge “Solve Me First”. This challenge helped me practice basic Python programming skills, including taking user input, performing simple calculations, and printing outputs correctly. Completing it earned me a badge, which I documented with a screenshot. This experience strengthened my problem solving abilities and familiarized me with coding practice platforms, which are essential for developing programming logic and preparing for future assignments or competitions. For the collaborative aspect, I used Google Forms to create a Digital Literacy Awareness Quiz for my batchmates. The form contains five questions, including multiple-choice and short answer types, focusing on safe internet practices, professional online presence, and useful digital tools. Responses are automatically collected in a linked Google Sheet, making it easy to analyze data and assess awareness levels among students. These platforms will help me academically by combining technical skill development with collaboration and communication skills. HackerRank enhances my coding and analytical abilities, while Google Forms enables me to design, share, and evaluate educational content effectively. Together, they support my growth as a digitally literate and technically capable student.

TASK: 4

A case of poor digital communication can be seen in a hypothetical workplace scenario where a project manager sends a vague email about a deadline change. The message lacks a clear date, time, and expectations, leading team members to interpret it differently. As a result, some employees submit their work late while others rush unnecessarily, causing confusion, missed targets, and reduced productivity.

This problem could have been avoided with clearer communication. The manager should have specified the exact deadline, provided context for the change, and confirmed that all team members understood the update. Using structured communication—such as bullet points, clear subject lines, and follow-up messages—would ensure everyone is aligned. Additionally, using collaborative tools or meetings to clarify important updates could prevent misunderstandings and improve overall efficiency.

TASK: 5

What surprised me most while researching digital communication was how often problems arise not from technology itself, but from small human errors like unclear wording, assumptions, or lack of confirmation. Even simple messages can be misunderstood if they are incomplete or poorly structured, leading to significant consequences in professional and personal settings. I also learned that tone is easily misinterpreted in digital formats, which can unintentionally create conflict.

As a result, one habit I will change is to review my messages more carefully before sending them. I will make sure my communication is clear, complete, and polite, and I will confirm important details when necessary. This will help reduce misunderstandings and improve the effectiveness of my communication.
